

PRD

Part of [EPD-2389 — Ship Exit Radar v1 — monthly "who is buying in your space" report](<https://linear.app/vequity/issue/EPD-2389/ship-exit-radar-v1-monthly-who-is-buying-in-your-space-report>) ·

Product spec — the product contract: use case, acceptance criteria, product-terms touch surface, shipped-set inventory, business rules, worked examples, edge cases, access, non-goals, open decisions, and risk.

Sections are numbered PRODUCT-I...PRODUCT-XI. Solution design and work breakdown are intentionally **not** in this document — engineering owns those later via /veq-eng-triage. Meta and prior art are in the Appendix section at the end of this document.

At a glance — the 6 components of this story

\ #	Component	The one thing to know	Detail
1	Report page	Replaces the "Coming soon" shell on both surfaces (own company + per portco): header, 3-tile stats strip, 6 buyer cards, sourced transactions table	PRODUCT-IV
2	The report itself	24-month window (5-year fallback under 10 deals); buyers ranked by deal count → capability overlap → recency; every table row has a source; chips are evidence, never guesses	PRODUCT-V.1 –.5, .8
3	Watch + refresh email	Per-user opt-in via "Watch this space"; watchers get an email on every monthly refresh, quiet months included	PRODUCT-V.3
4	Schedule + next-update promise	Page shows the next refresh date from the server, and the refresh lands on it; a failed run keeps the last good report, no error shown	PRODUCT-V.6
5	First-report ops	Initial reports are operator-triggered; a "being prepared" placeholder shows until one exists	PRODUCT-V.7, PRODUCT-IX
6	What's changed	Each refresh tells a returning user what's new since the last run — new transactions, new buyers, buyers with more deals; presentation delegated to design; feeds the email headline	PRODUCT-V.9

Everything below is the full contract an implementing agent works from. Humans: read this table, the mock attached to [EPD-2389](#), and PRODUCT-II (acceptance criteria) — skip the rest.

Design brief

The mock on [EPD-2389](#) is the layout reference — but it shows the best case. Design for reality:

- **Sparse is the default.** Most transaction rows will have **no capability chips**, most values are "n/d", and a thin space may have 2 rows and 1 buyer card. Design the sparse render first; the dense mock is the ceiling.
- **States to design:** loading · "being prepared" placeholder (copy is yours — no error language, no promised date) · 5-year-fallback header label · the dense and sparse ready states. A failed refresh is deliberately invisible: last good report stays, no banner.
- **Watch interaction is yours to propose:** watched-state appearance, whether unwatch exists, and how the subscription is confirmed. Undecided on purpose.
- **"What's changed" presentation is yours:** own section or woven into the existing ones — either way a returning user must be able to see the new transactions, the new buyers, and the buyers with more deals since the last refresh (PRODUCT-V.9).
- **Ignore in the mock:** the top-right toggle and "since 2025" phrasing — window rules in PRODUCT-V.1 govern.

PRODUCT-I. Use case [P0]

Who

Buyer-role members of Intelligence-enabled organizations, in both personas. A strategic company (e.g. Inspira Financial) views Exit Radar about itself. An investment firm (e.g. Saturn Five) views Exit Radar per portfolio company. No new persona and no self-serve signup in v1.

Trigger

A member opens Exit Radar from the Intelligence sidebar (own company, or a portco page) wanting to know who is acquiring companies like theirs and why. After the initial report, the recurring trigger is the monthly refresh.

Today

The Exit Radar route and the card at the bottom of Company Home render a "Coming soon" marketing card with a "Let me know when available" button that only writes to the browser. No report exists anywhere in the product. The underlying buyer-direction intelligence report

exists internally but is operator-run and rendered only on admin surfaces. (Screenshot of the coming-soon page to be attached by PO.)

After this story

An Inspira Financial member opens Exit Radar and sees "Who is buying in Inspira's space": a stats strip (deals in the space in the last 24 months, % strategic, % PE), up to six most-active-buyer cards with capability chips highlighting the overlap Inspira holds and a one-line buying thesis each, a named recent-transactions table where every row carries a stated reason and a source link, the date the next refresh will occur, and a "Watch this space" button that subscribes that user to the refresh email. (Reference mock attached to the issue.)

Why now

Verbally discussed with customers and important for sales demos. The Exit Radar promise has been visible in onboarding and marketing copy as "coming soon" since August; shipping two months later keeps sales demos blocked and stretches the credibility gap in front of committed customers.

PRODUCT-II. Acceptance criteria — each with its own check [skill drafts; PO confirmed 2026-09-14]

Pinned environment: **Production** (fixture IDs verified 2026-09-14; Test equivalents unverified — see PRODUCT-VI). Checks referencing a refresh run mean: an operator triggers the monthly run for the fixture org.

\#	Given / When / Then	Check (pinned env)	Source
1	Given Inspira Financial has completed Intelligence onboarding and its initial report exists; When a member opens Exit Radar; Then the page shows all 4 sections from the inventory and no Coming soon badge	Log in as an Inspira member → Intelligence → Exit Radar; count sections: header, stats strip, buyer cards, transactions; confirm no "Coming soon" badge	PRODUCT-I V Set 1, PRODUCT-VI#1

2	Given the report window is the last 24 months; When the stats strip renders; Then it shows exactly 3 tiles — deal count in window, % strategic, % PE — computed over all deals in the window	Recompute the three numbers by hand from the report's own transaction list and stated corpus count; % strategic + % PE may be under 100 (gap = unclassified)	PRODUCT-I V Set 2, PRODUCT-V.2
3	Given the space has more than 6 named buyers; When the buyer section renders; Then at most 6 cards appear, ranked by deal count, then capability overlap with the subject, then recency; each card shows name, buyer-type label, deal count, largest disclosed value, capability chips with the subject's held capabilities highlighted, and a one-line thesis	Inspect each card for all 6 elements; verify ordering against the counts shown on the cards	PRODUCT-I V Set 1 #3, PRODUCT-V.4
4	Given the transactions table renders; When a reviewer opens any row's source link; Then it opens the recorded source; rows without a source do not appear; value shows "n/d" where undisclosed; at most the 20 most recent rows	Click 3 source links; scan the table for any row missing a source; count rows ≤ 20	PRODUCT-I V Set 1 #4, PRODUCT-V.5
5	Given a company whose space has fewer than 10 deals in the last 24 months; When its initial report generates; Then the report covers 5 years and the deal-count tile is labeled with that window	Use a low-activity fixture company; verify the tile label reads the 5-year window	PRODUCT-V.1, PRODUCT-VI#3
6	Given a user clicked "Watch this space" on a company's report; When the monthly refresh completes — including a quiet month with no new deals; Then that user receives the refresh email linking to the page, and users who did not click receive nothing	Two users in the fixture org, one watching; operator triggers the refresh; check both inboxes	PRODUCT-V.3, PRODUCT-I V Set 3 #1

7 (negative)	Given an Intelligence org or portco whose Exit Radar report has not been generated yet; When a member opens the page; Then a placeholder explains the report is being prepared — not the Coming soon marketing card and not an error	Open Exit Radar as the Saturn Five Demo firm against a portco with no report; verify placeholder copy	PRODUCT-V.7, PRODUCT-VI#3
8	Given an investment-firm member; When they open a portfolio company's Exit Radar; Then the same 4-section report renders for that portco	Log in as Saturn Five Demo member → portfolio company → Exit Radar; compare section inventory to criterion 1	PRODUCT-I V Set 4 #2, PRODUCT-VI#2
9	Given a report is displayed; When the member reads the header; Then the page states when the next refresh will occur, and the refresh actually lands on that stated date	Note the displayed next-update date; confirm the following refresh occurs on it (or, after a failed run, that the date moves rather than passing silently)	PRODUCT-V.6, PRODUCT-I -After
10	Given a company's report refreshes with new activity since the previous run; When a member opens the page; Then they can see which transactions are new, which buyers are new to the list, and which buyers' deal counts increased — and the watcher email for that refresh leads with the same headline	Run two consecutive refreshes on the fixture org with corpus changes between them; verify the delta on the page and in the email	PRODUCT-V.9, PRODUCT-I V Set 1 #5

PRODUCT-III. What this touches — in product terms

[PO]

Screens

Platform app, Intelligence area: the Exit Radar page (own-company and per-portco) goes from "Coming soon" to the live report for **all** Intelligence orgs; the Exit Radar card on Company Home leads to the real page. One new email (refresh notification).

Information

The named-buyer landscape per company — who bought, what capability each deal added, the buyer's stated reason with a source — exists internally today in the operator-run intelligence report. New to customers in this form: productized page, corpus-wide buyer counts, the report window, and the next-update date.

AI/automation

The engine's buyer-direction report gains a monthly cadence per subscribed company (today it runs only when an operator triggers it). Initial reports in v1 remain operator-triggered; the cadence takes over after the first report exists.

Outside systems

Email delivery via the existing email provider. Source links on transaction rows open external press releases and articles.

Scale

Per Intelligence org and portco on a monthly schedule — not a whole-database batch. Today that is 3 onboarded orgs in production.

PRODUCT-IV. Shipped-set inventory [P0 confirmed 2026-09-14]

Set 1: Report sections — N = 5

\ #	Instance	What it shows (plain English)	How it's derived / when it fires	Detail
1	Header	"Who is buying in {company}'s space", subtitle explaining the window and green-chip meaning, next-update date, "Watch this space" button	Renders whenever a report exists	PRODUCT-V.6
2	Stats strip	Headline numbers for the report window	Computed from the report's deal corpus	Set 2, PRODUCT-V.2
3	Most active buyers	Up to 6 cards: buyer name, Strategic-or-PE label, deal count in the space, largest disclosed value, capability	Counts from the full corpus, not only sourced rows; ranked per PRODUCT-V.4	PRODUCT-V.4

		chips with subject overlap in green, one-line buying thesis		
4	Recent transactions	Table: date, buyer → target, capabilities added, value where disclosed, stated reason quote, source link	Only sourced deals; 20 most recent	PRODUCT-V.5
5	What's changed	New sourced transactions, buyers new to the list, and buyers whose deal count increased — all relative to the previous refresh	Every refresh after the first (the initial report has no baseline); placement delegated to design — own section or integrated into sections 3–4	PRODUCT-V.9

Set 2: Stats strip tiles — N = 3

\ #	Instance	What it shows	How it's derived	Detail
1	Deals in the space	Count of deals in the report window; label names the window (24 months, or 5 years on fallback)	Full corpus for the space	PRODUCT-V.1
2	% strategic	Share of window deals with a strategic acquirer	Over all deals in the window	PRODUCT-V.2
3	% PE	Share of window deals with a PE / investment acquirer	Over all deals in the window; gap to 100 is the unclassified share	PRODUCT-V.2

Set 3: Emails — N = 1

\ #	Instance	What it does	When it fires	Detail
1	Report refreshed	Leads with the what's-changed headline (e.g. "3 new deals, 1 new buyer in your space"); links to the page. Quiet month: "No new activity — next check {date}"	On every monthly refresh, quiet months included, to users who clicked Watch on that company's report	PRODUCT-V.3, PRODUCT-V.9

Set 4: Surfaces — N = 2

\ #	Instance	Who	Detail
1	Own-company Exit Radar page	Strategic org viewing itself	PRODUCT-VI# 1
2	Portco Exit Radar page	Investment firm viewing one portfolio company	PRODUCT-VI# 2

Cadence is not a set (monthly only, N = 1). Loading / empty / failed states are handled in PRODUCT-VII.

PRODUCT-V. Business rules & semantics [P0 decided 2026-09-14]

1. Report window and fallback

The initial report covers the last 24 months. If the space has fewer than 10 deals in that window, the report is built over the last 5 years instead, and the deal-count tile is labeled with the window actually used. The fallback is never silent.

2. Percentage tiles

% strategic and % PE are computed over **all** deals in the window, not only classified ones. The two tiles may sum to less than 100; the gap is the unclassified-buyer share and is not separately displayed.

3. Refresh cadence and email

Every company with a generated report refreshes monthly. Cadence is fixed at monthly in v1, but the team should know this is intended to become user-configurable later — do not build in a way that precludes it. On every refresh — including a quiet month with zero new deals — each user who clicked "Watch this space" on that company's report receives the refresh email linking to the page. The email leads with the what's-changed headline (PRODUCT-V.9); a quiet month's email says there was no new activity and names the next check date. Users who did not click receive nothing. Watching is per user per company.

4. Buyer ranking and cap

The buyer section shows at most 6 buyers, ranked by deal count in the space, then by capability overlap with the subject, then by most recent deal. Strategic and PE buyers appear in the same section, each card labeled with its buyer type; PE cards use the same freeform thesis line as strategics.

5. Transactions table vs corpus counts

The table shows only deals that carry a source; every row has a working source link; deal value renders "n/d" where undisclosed; the table caps at the 20 most recent rows. Buyer-card deal counts come from the full corpus and may exceed what the table shows — the header subtitle says so.

6. Next update is a promise

The page shows the date the next refresh will occur, supplied by the system of record for the schedule — never computed client-side. The refresh happens on that date. A failed run keeps the last good report on the page, shows no error to the member, and moves the next-update date to the retry.

7. Missing report placeholder

When a report has not been generated for a company, the page shows a placeholder explaining the report is being prepared. It is not the Coming soon marketing card and not an error state. Exact copy: DELEGATED to design — constraint: no error language, and it must not promise a specific arrival date.

8. Capability chips are evidence, never guesses

A capability chip (on a buyer card or a transaction row) appears only when it is a real derived capability. Transaction rows may render without chips when none are derivable — historical deal-level capability coverage is near zero before September 2026. Derivation method: DELEGATED to engineering; PO ratifies on a sample at PR review.

9. What's changed since the last refresh

Every refreshed report identifies, relative to the previous run: new sourced transactions, buyers new to the buyer list, and buyers whose deal count increased. A returning user must be able to see all three without comparing reports by hand; whether that is its own section or woven into the existing ones is DELEGATED to design. The refresh email leads with the same delta as a headline. The initial report has no baseline and shows no delta. A quiet month shows "no new activity since {last refresh}" on the page and in the email.

PRODUCT-VI. Worked examples — fixtures [env pinned; IDs verified in Production 2026-09-14]

Fixture	Value
---------	-------

Environment	Production (IDs below verified 2026-09-14). Test equivalents unverified — seed by completing Intelligence onboarding for equivalent orgs in Test before acceptance, or accept in Production
Inspira Financial (strategic, onboarded)	f65c3393-edff-4d04-bf37-8b036e5ebc57
Saturn Five Demo (investment, onboarded)	20edc1e2-ea36-461c-be87-3942bfa47fa4
Inspira Financial Demo (strategic, onboarded)	191207d4-806c-4d9f-aae7-fc24aff91d10

\#	Actor	Input (exact)	Expected outcome (as the user sees it)
1	Member of Inspira Financial (strategic persona)	Open Intelligence → Exit Radar	"Who is buying in Inspira's space": stats strip, up to 6 buyer cards with Inspira's capability overlap in green, sourced transactions table, next-update date, Watch button. No Coming soon badge
2	Member of Saturn Five Demo (investment persona)	Open a portfolio company → Exit Radar	The same 4-section report about that portco
3 (alternate)	Member of Saturn Five Demo	Open Exit Radar for a portco whose report has not been generated	"Being prepared" placeholder — not the marketing card, not an error
4 (email)	Two Inspira members, one watching	Operator triggers the monthly refresh	The watcher receives the refresh email linking to the page; the non-watcher receives nothing

PRODUCT-VII. Edge cases [decided 2026-09-14]

\ #	Situation	User sees	What must be true	State
-----	-----------	-----------	-------------------	-------

1	Missing / partial data	Chip-less transaction rows; "n/d" values; % tiles not summing to 100; placeholder when no report	Nothing rendered is a guess presented as data	DECIDED (PRODUCT-V.2/.5/.7/.8)
2	Permission denied / wrong tenant	A user outside the org can never reach the report	Same org-scoped gating as the rest of Intelligence; no cross-org visibility	DECIDED
3	Duplicate / already exists	n/a	Reports are regenerated, page always shows the latest	N/A — read-only surface over insert-only reports
4	Concurrent edit / stale version	n/a	No member-editable state beyond the Watch toggle	N/A
5	Upstream failure (refresh run fails)	Last good report with its date; next-update date moved; no error	A failed run never blanks or corrupts the displayed report	DECIDED
6	Partial failure / retry (email)	Possibly a missed email	A watcher who misses one email still receives subsequent ones; page correctness never depends on email delivery	DELEGATED — constraint stated; PO ratifies at PR review
7	Volume spike / very large space	A bounded page	Caps: 6 buyer cards, 20 table rows	DECIDED (PRODUCT-V.4/.5)

PRODUCT-VIII. Access & visibility [PO]

Who can see / act

Any active member of an Intelligence-enabled org sees the org's own Exit Radar (strategic) or every portco's Exit Radar (investment firm) — same population that sees other portco intelligence today. Anyone can click Watch for themselves. Should see: a Saturn Five Demo member opening any of its portcos. Should NOT see: a member of a different buyer org, advisors, or unauthenticated visitors.

Who must NEVER see this

Users outside the subject's org. And in the other direction: the report's buyer cards and theses must derive only from the public transaction corpus — **never** from another buyer firm's validated mandates, criteria, or platform activity. The onboarding data promise ("no buyer can ever view another firm's acquisition criteria") binds this report.

PRODUCT-IX. Non-goals

Not doing	Why
Self-serve business-owner signup	v1 audience is existing Intelligence orgs; new persona + billing is its own project
Cadence chooser	Monthly fixed in v1; design must not preclude it later (PRODUCT-V.3)
Positioning guidance section	Promised in marketing copy; deferred until the core report earns trust
Full report body in email	Email is a notification linking to the page
Org-wide notification management	Who-gets-what across many portcos is a separate, larger issue (PO, 2026-09-14); per-user Watch only
Kill switch / per-org off	Declined; operator-triggered first reports are the quality gate
Automatic first report at onboarding completion	v1 first reports are operator-triggered while quality is watched; automation is a follow-up
PE platform/add-on card framing	PE buyers get the same card shape with a buyer-type label

Direction — trade-offs for the team to weigh (not v1 scope)

These are not requirements. They are context the PO wants considered at eng triage — when a build decision is a coin flip, pick the side that keeps these doors open.

Scheduled vs event-driven — the trade-off that matters most

Two shapes can produce this report. **Pull (scheduled)**: each report re-asks "what's in my space?" monthly — 400 reports ≈ 13 runs/day, exactly what the engine does today on operator trigger. **Push (event-driven)**: each new deal at ingest asks the reverse — "whose spaces does this deal belong to?" — and appends to those reports' change logs (~3k deals/month against a subject index).

Consideration	Pull (scheduled)	Push (event-driven)
Exists today	Yes — operator-triggered engine run	No — needs ingest hook, reverse index, membership store
Cost at 400 reports	Trivial; LLM compose is the expensive unit and can be skipped on quiet months	Same compose cost; retrieval amortized
Cost at 10k+ reports (self-serve future)	Monthly full re-retrieval gets wasteful	Scales with deal flow, not report count
Instant alerts (Alerts / Morning Brief shells)	No — monthly latency floor	Yes — native
Failure modes	Few; recompute heals everything	Re-membership needed when a subject's profile changes

PO recommendation — team to confirm at eng triage: start scheduled, but derive the what's-changed delta (PRODUCT-V.9) from a persisted per-run snapshot of the deals in the space — set-difference between runs. That snapshot is the seam: v2 flips to updating membership at deal ingest, and everything downstream (delta section, email headline, future alerts) already consumes membership changes without caring which side produced them. Producer swap, not rewrite.

Other doors to keep open

Door	Why
The report will end with an action — positioning guidance (deferred) and, for the PE persona, "this buyer is assembling what your portco has → activate the mandate"	Competitors (Harmonic Scout) end with an intro path and drafted outreach; awareness-only reports feel unfinished
Personas will diverge — owner-view and PE-per-portco share one template today; expect emphasis to split	An owner asks "should I sell"; a firm asks "when do we exit"
A new audience is coming — self-serve business owners are the non-goal that returns	The original product vision starts at account creation

The guardrail: our differentiation is sourced stated reasons + capability overlap — what breadth-signal competitors cannot render. Never trade it for generic signals (headcount, funding, web traffic). Density of evidence beats breadth of feed.

PRODUCT-X. Open decisions — BLOCKING

none

PRODUCT-XI. Risk & rollout — in business terms [PO]

Blast radius

Three Intelligence orgs in production today, including the unnamed committed customer — plus watcher inboxes once refresh emails flow. A wrong buyer name or fabricated-looking thesis in a sales demo is the expensive failure.

Instant-off

None needed (PO, 2026-09-14). Operator-triggered first reports are the quality control.

First symptom

A member or the customer sees a wrong buyer, a dead source link, or a next-update date in the past — most likely reported by email to the team.

Wrong data shipped

Must be repairable by an operator rerun that supersedes the displayed report without deleting history.

Appendix

Meta

Field	Value
Story type	feature
Origin evidence	Verbal customer discussions (customer unnamed by PO choice); needed for sales demos; PO-supplied reference mock (attached to EPD-2389)
Domain contact	Ryan Westlake
Deadline driver	Sales demos; verbal customer commitments — no hard calendar date

Appetite	No cap stated — verbally committed to customers and important for sales demos
----------	---

Prior art

Anchor	Role
Exit Radar coming-soon page (/intelligence/exit-radar) and Company Home card	The exact surfaces this story replaces; "Watch this space" supersedes the localStorage-only notify button
Buyer-direction M&A intelligence report (admin surfaces)	The engine output this productizes — already carries summary, buyer candidates with precedent deals, most-active-acquirers, why-deals claims, stats, caveat [derived]
Add-on intelligence report on Company Home (Market Activity + Relevant Transactions)	The shipped in-product rendering pattern closest to this page [derived]
Harmonic Scout (https://harmonic.ai/scout/); PitchBook email alerts	External prior art the PO cited: role-tailored periodic M&A digests; PitchBook offers daily/weekly/monthly cadences on saved searches

Data-reality notes (grounding, verified in Production 2026-09-14)

Fact	Value
Deals recorded 2024 / 2025 / 2026 YTD	34k / 25k / 11k
Deals with a stated strategic rationale	\~35–50%
Deals with a disclosed value	<1%
Deals with deal-level capability tags	\~0 before Sept 2026 (columns new, unbackfilled) — hence PRODUCT-V.8
Recent deals with PE/investment acquirer	\~1 in 8
Intelligence-onboarded orgs	3 (the PRODUCT-VI fixtures)

Original ticket content

N/A — story freshly created from the 2026-09-14 product-triage interview; the PRD document was empty before this write.
